

# WIFI

## Speeds Slow?

### See How Speeds Are Affected By Other Factors

**1****WIFI vs. Ethernet**

What kind of connection to the Internet are you using?

A wired cable versus WIFI can make a difference. Often you will see slower speeds when you are going wireless.

**2****Distance**

Where are you in proximity to your router?

The further away, often the slower the speeds.

**3****Environment**

Do you have a stone fireplace or a log cabin?

You have to take into account the things around you. WIFI can't move through all materials and maintain its speed. You will lose signal or experience slow down near some structures.

**4****Devices**

Still using that iPhone 6?

The way devices process WIFI has been upgraded. You may notice on your new TV that you seem to have faster Internet than on your smart phone. The age of your device will determine the speed of your WIFI experience.

**5****Router**

How old is your router?

Most routers are at their best for 2-3 years. At that point, they start to slow down. As technology changes quickly, it is important to keep your router up to date for the best experience. Apex Managed WIFI is now available and provides a WIFI 6 experience.

**6****Spyware**

Are you protected?

Protecting your computer from a virus is key to making sure you are running your devices efficiently. Some viruses, once into the device, run in the background and can take away from the speed or bandwidth.
